

FLOATING COVERS ON WATER RESERVOIRS

Climate change, with reduced rainfall and prolonged droughts, has increased pressure on water resources for public consumption, agriculture, and tourism. As a result, there is a greater need for water storage and quality preservation. The installation of covers on water reservoirs is an urgent necessity, particularly in southern Europe.

The webinar aims to share knowledge, discuss best practices, and explore innovations in the use of geomembranes for this type of application. It will be presented by Eng. Graham Fairhead (President of IGS Australia).

WEBINAR

13 September

9:00-9:50 h

(GMT + 1 hour)

Topics to be addressed

- Applications and benefits of floating covers
- Design considerations
- Material selection
- Life expectancy
- Construction and maintenance

Registration

- free
- mandatory before 11/09/2024
